DETAILED ACTION

EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Kiven Guallano on November 06, 2008. Agreed to amend the dependency of claims 3, 4, 9 and 10, which were depend on canceled claim 2, to be depend on claim 1, and claims 15, 16, 18-21, which were depend on cancelled claim 14, to be depend on claim 13.

Reasons for Allowance

2. The following is an examiner's statement of reasons for allowance: In response to the non-final office action, dated April 17, 2008, further in view of applicant's amendments filed on July 17, 2008, the application has been carefully reviewed and respectfully considered.

According to applicant's remarks based on currently filed amendment, as discussed in page 9 through 10, independent claims 1, and 13 has been amended

based on previously objected claims having Allowable subject matter (i.e., claims 2 and 14). Claims 2 has been included on the rejected claim 1, and claim 14 is included in claim 13, in view the above indicted amendment claims are in condition for allowance, and therefore, the rejection has been withdrawn.

Further, independent claims 1 and 13 are allowed, for the reasons given below, including all dependent claims depend on therefrom:

With respect to claims 1, 3-12, the prior art searched and of record neither anticipates nor suggests the claimed invention as amended. In particular, direction for reading the image region, the image region having an image region length in the reading direction; a movement control unit controlling the original reading unit to provide an acceleration region where the original reading unit accelerates from a halted state to a moving velocity, a constant-velocity region where the original reading unit maintains the moving velocity, and a deceleration region where the original reading unit decelerates from the moving velocity to the halted state, the original reading unit reading the image region at least in the constant-velocity region, the original reading unit starting to decelerate at a deceleration start position that is positioned between the constant-velocity region and the deceleration region; a region-length acquisition unit acquiring the image region length; a velocity setting unit setting the moving velocity of the original reading unit based on a specified image reading mode; and a deceleration-start-position setting unit setting the deceleration start position based on the moving velocity set by the velocity setting unit; wherein the deceleration-start-position setting unit s includes a velocity comparison unit comparing the moving velocity set by the

velocity setting unit with a reference velocity, thereby obtaining a comparison result; and wherein, if the velocity comparison unit has obtained the comparison result that the moving velocity set by the velocity setting unit is greater than the reference velocity, the deceleration-start-position setting unit sets the deceleration start position to one of a position within the image region and a position immediately downstream of the image region in the reading direction, depending on the image region length and the moving velocity set by the velocity setting unit.

Further, regarding to claims 13, 12-21, the prior art searched and of record neither anticipates nor suggests an original mounting portion on which an original having an image region is placed; an original reading unit movable in a reading direction for reading the image region, the image region having an image region length in the reading direction; a movement control unit controlling the original reading unit to provide an acceleration region where the original reading unit accelerates from a halted state to a moving velocity, a constant-velocity region where the original reading unit maintains the moving velocity, and a deceleration region where the original reading unit decelerates from the moving velocity to the halted state, the original reading unit reading the image region at least in the constant-velocity region, the original reading unit starting to decelerate at a deceleration start position that is positioned between the constant-velocity region and the deceleration region; a region-length acquisition unit acquiring the image region length; and a deceleration-start-position setting unit setting the deceleration start position based on the image region length acquired by the region-

length acquisition unit; wherein the deceleration-start-position setting unit includes a region-length comparison unit comparing the image region length with a reference region length, thereby obtaining a comparison result; and wherein the deceleration-start-position setting unit sets the deceleration start position to one of a position within the image region and a position immediately downstream of the image region in the reading direction, depending on the comparison result of the region-length comparison unit.

Therefore, claims 1, 3-13, 15-21, are Allowed for the reasons the claimed invention are distinct from the prior art searched and of record neither anticipates nor suggests the claimed invention alone or in combination as amended.
